QUALITY & MATERIAL CONTROL STATEMENT

REMARKS

NO.	QUALITY & MATERIAL CONTROL
01	In-house wire drawing and material certification All wire is prepared from stainless steel rod under controlled material workflow. Mill certification, including heat number, chemical composition, and mechanical-property reference, can be supplied with orders when required.
02	Incoming raw material verification Incoming raw materials are verified before production through material review, wire-diameter checks, and mechanical-property control where required. Non-conforming stock is separated from production use.
03	Specification and drawing confirmation Specifications, drawings, dimensions, application conditions, and technical questions are confirmed with the buyer before production begins to reduce mismatch risk during manufacturing.
04	Automated and standardized production Forming, welding, assembly, and belt-structure control follow standardized production procedures to support repeatability, dimensional consistency, and stable output.
05	In-process inspection checkpoints Defined checkpoints are used during production under the ISO 9001 quality system. Dimensional, structural, visual, edge, surface, and product-specific checks are applied by belt type.
06	100% final QA before packing No order is released for shipment before final QA. Final checks may include dimensional accuracy, weld integrity, edge treatment, surface condition, product-specific function, and packing readiness.
07	Pre-shipment photo and video confirmation Product photos, dimensional photos, packaging photos, and inspection videos can be prepared before shipment when required by the buyer or project type.
08	Order-based traceability records Production and inspection information is retained by order, including material use, quantity, inspection notes, and shipment release status. Records can be reviewed upon request.
09	Factory audit and third-party inspection support Buyer audits and third-party inspections can be coordinated for long-term OEM cooperation, distributor evaluation, or quality-sensitive supply chains.

Public-use rule: Product photos, package photos, technical drawings, or videos used in public materials must remove customer names, shipping marks, PO numbers, email screenshots, faces, and private project information.
